

## Line XVR 8 multi-format video recorder

[Line XVR 8](#) is an advanced multi-format video recorder. The main advantage of this format is its ability to work with several types of cameras simultaneously:

- CVI, CVBS, HD-TVI, AHD (**up to 8 Megapixel resolution**);
- IP cameras from all the most well-known manufacturers (more than four thousand models with unlimited resolution).

Ability to simultaneously **connect up to eight cameras**. The only restriction for resolution up to 64 Mbps is the maximum data stream transfer speed of the channel (total device bitrate).

The video recorder is supplied with a [Line software licence](#) and **full access to its features**. You can connect **an unlimited number of client sites** to the equipment, which will enable you to remotely manage the process on any personal computer, at the office or at home, running Windows x64 or x86, Vista, 7, 8, 10, or XP. CCTV can also be arranged using smartphones, [iOS and Android](#) tablets, web browsers with Flash support and monitors directly connected to the video recorder.

The key feature is **the ability to automatically configure each channel separately**. It is not necessary to create templates before starting operation for different types of cameras connected to the client's CCTV system. The video recorder will find the analogue signal and effectively integrate the camera into the system. The remote client site will make it possible, if necessary, to configure a new IP device when connected, without rebooting the device.

The design of the Line XVR recorder includes a pair of 3.5-inch hard drives (**total up to 24 terabytes**). This makes it possible to expand the system's current capabilities to analyse record archives, localization observation and other options. The hard drives go in the device's body.

The equipment set includes a USB mouse for switching operating modes: switch to general observation, archive files, or open individual cameras in the full screen mode.
